REPORT DEPTH

Executive Summary

1) Company Snapshot

- **Business:** Tomoro AI Ltd (brand: **Tomoro**) — enterprise AI strategy + build + infrastructure + rollout, with emphasis on **agentic / multi-agent systems, RAG/knowledge pipelines**, and governed delivery in **regulated industries**.
- **Footprint:** London, Edinburgh, Singapore (APAC HQ), Sydney, Melbourne.
- **Proof points / clients referenced:** Supercell (Brawl Stars RT-GP1 gameplay/support agent), Virgin Atlantic (Concierge rollout), Fidelity, DPD, OakNorth Bank.
- **Tech signals:** Founded 2023 (alliance with OpenAI). Works with OpenAI and open source models; references Nvidia/Microsoft ecosystem. Demonstrated **multi-modal** agent patterns (classifiers →

retrieval → response generation → persona control) and released

- **open-weights multimodal embeddings** (Tomoro CoLQwen3).
Scale signals: ~**120–150** headcount estimate; company statements suggest ~**130** by end-2025/start-2026; rapid international expansion and stated multi-year Scotland talent investments (£4m in 2024; £10m over 3 years announced 2025). Revenue not disclosed; company-reported **10x+ monthly revenue growth** (directional).

2) Top 3 Opportunities

1. Inbound qualification agent + fast-track NDA workflow (Acquire)

- **Goal:** Cut speed-to-lead and eliminate NDA delays for regulated prospects.
- **Mechanism:** Brand-aligned intake agent captures structured qualification, auto-routes by region/team, and triggers **template-based NDA generation + e-sign**.
- **Expected uplift:** Speed-to-lead **<1 hour**, **50–80%** reduction in time-to-NDA-sign; **15–30%** reduction in rep time spent on low-fit inbound.

2. Agent observability + prompt/behaviour regression testing (Fulfil)

- **Goal:** Increase reliability of multi-agent systems and persona/brand control while reducing debugging and incidents.
- **Mechanism:** End-to-end tracing of tool calls/retrieval/steps + automated regression suites and CI gating for safety/brand thresholds.
- **Expected uplift:** **50–80%** fewer critical regressions; **20–40%** less debugging time; **30–60%** reduction in unsafe/brand-off outputs.

3. PoC-to-production NFR gate + cost/latency estimator (Convert)

- **Goal:** Improve PoC→prod conversion and prevent cost/latency surprises for agentic/multi-modal workloads.

- **Mechanism:** Standard NFR capture (SLA, privacy/safety, monitoring) + estimator built from real PoC traces and usage scenarios.
- **Expected uplift:** 30–60% reduction in PoC→prod failures; fewer late blockers; materially lower inference spend variance.

3) Why Now

- **Scaling pressure:** Fast headcount growth and multi-region delivery increases the cost of inconsistent intake, tooling, and release practices.
- **Market validation:** High-profile production launches (e.g., **Virgin Atlantic Concierge**) raise expectations for **SLA, safety, and brand alignment**—making observability/NFR gates urgent.
- **Operational leverage:** With a premium cost base (specialist hiring across regions), compressing **cycle time** (NDA → discovery → PoC → prod) and reducing **engineering rework** are direct margin levers.

4) 90-Day Pilot Overview

Pilot objective: Deliver measurable cycle-time and reliability improvements using “quick win” opportunities that reuse existing systems (forms/CRM/calendar/e-sign + observability stack/CI).

Workstreams & timeline

- **Days 0–15 (Design + data readiness):**
 - Map current inbound → CRM stages → NDA → first meeting; define required intake fields and routing rules.

- Define regression test sets (representative conversations), safety/brand policies, and trace schema.
- Agree NFR templates and estimator assumptions (latency, throughput, cost, privacy/safety).
- **Days 16–45 (Build MVPs):**
 - Deploy inbound agent on contact/referral paths; integrate CRM + calendar + e-sign; implement template-only NDA automation.
 - Implement tracing and initial regression suite; add release gate thresholds and rollback/runbook triggers.
 - Add NFR gate checklist + automated report; prototype cost/latency estimator from traces.
- **Days 46–75 (Run + iterate):**
 - A/B test inbound flow (agent-assisted vs baseline) for response time, qualification completeness, NDA turnaround.
 - Run regression suite on every prompt/tool update; tune policies, redaction, and dashboards.
 - Use NFR gate outputs in 1–2 live PoCs to validate go/no-go discipline.
- **Days 76–90 (Handover + scale plan):**
 - Finalize governance: logging/audit, consent, template controls, human-in-the-loop approvals.
 - Produce playbooks and rollout plan across regions (London/Edinburgh/Singapore/AU).

5) KPIs to Track

Acquire (Inbound + NDA)

- Median **speed-to-lead** (target: **<1 hour**)
- % **inbound leads auto-scored & routed** without manual intervention

- **Time from first contact → NDA signed** (target: **-50–80%** vs baseline)
- Rep hours/week spent on **unqualified inbound**

Convert (PoC → Prod readiness)

- **% PoCs progressing to production**
-
- **Variance** between estimated vs actual **inference spend**
- **p95 latency vs target** (PoC and first prod release)

Fulfil (Reliability + governance)

- **Critical regressions per sprint**
- **MTTR** and time-to-diagnose (supported by traces)
- Eval rates: **unsafe/brand-off** outputs (pre-release + production sampling)
- **Release approval cycle time** (as gates become standard)
